Annotatsiya. *Ushbu maqolada qilichbozlik sportida tezkorlik va reaksiya tezligini rivojlantirishning zamonaviy usullari ilmiy-uslubiy jihatdan yoritilgan. Qilichbozlik musobaqalarida sportchining raqib harakatlarini tez anglash, qisqa vaqt ichida to‘g‘ri qaror qabul qilish va texnik harakatlarni yuqori aniqlikda bajarish qobiliyati muhim ahamiyatga ega.*

Maqolada maxsus jismoniy mashqlar, harakatli mashqlar, juftlikda bajariladigan topshiriqlar va musobaqa usullarining tezkorlikni rivojlantirishdagi o‘rni tahlil qilingan.

Shuningdek, yosh qilichbozlarning individual xususiyatlarini hisobga olish, mashg‘ulot yuklamalarini to‘g‘ri rejalashtirish hamda zamonaviy pedagogik texnologiyalardan foydalanish masalalari ko‘rib chiqilgan.

Kalit so‘zlar: *qilichbozlik, tezkorlik, reaksiya tezligi, yosh sportchilar, jismoniy tayyorgarlik, koordinatsiya, maxsus mashqlar, sport mashg‘ulotlari.*

Аннотация. *В данной статье рассматриваются современные методы развития быстроты и скорости реакции у спортсменов, занимающихся фехтованием. В соревновательной деятельности фехтовальщика важное значение имеют способность быстро распознавать действия соперника, принимать правильные решения за короткий промежуток времени и точно выполнять технические приёмы. Анализируется роль специальных физических упражнений, подвижных заданий, парных упражнений и соревновательного метода в развитии быстроты. Особое внимание уделяется учёту индивидуальных особенностей юных фехтовальщиков, правильному планированию тренировочных нагрузок и применению современных педагогических технологий.*

Ключевые слова: *фехтование, быстрота, скорость реакции, юные спортсмены, физическая подготовка, координация, специальные упражнения, спортивные тренировки.*

Annotation. *This article examines modern methods for developing speed and reaction time in fencing athletes. In fencing competitions, the ability to recognize an opponent's actions quickly, make appropriate decisions within a short period, and perform technical movements accurately is essential. The article analyzes the role of special physical exercises, movement-based activities, paired exercises, and competitive training methods in improving speed and reaction abilities. Particular attention is given to individual characteristics of young fencers, appropriate planning of training loads, and the application of modern pedagogical technologies.*

Keywords: *fencing, speed, reaction time, young athletes, physical fitness, coordination, special exercises, sports training.*

INTRODUCTION

Fencing is a sport that requires a combination of physical strength, technical skills, tactical thinking, and psychological readiness. Among the physical qualities necessary for successful performance, speed and reaction ability occupy a particularly important position.

During a fencing match, athletes must continuously observe their opponents, evaluate their movements, and select appropriate offensive or defensive actions.

These processes take place within a very short period. Therefore, even a slight improvement in reaction speed may contribute to more effective competitive performance.

The development of speed and reaction abilities is especially important during the preparation of young fencers. At this stage, athletes acquire basic movement skills and develop the physical abilities necessary for further sporting specialization.

The effectiveness of training depends on the correct selection of exercises, the systematic organization of training sessions, and the consideration of individual characteristics. Modern fencing training should combine general physical preparation with specialized exercises that reproduce the movements and situations encountered during competitions.

The purpose of this article is to examine modern methodological approaches to developing speed and reaction abilities in fencing athletes and to identify practical recommendations for improving the training process.

THE IMPORTANCE OF SPEED IN FENCING

Speed is one of the most important physical qualities in fencing. It determines how quickly an athlete can perform movements, respond to an opponent, and execute offensive or defensive actions. Fencing requires different forms of speed, including reaction speed, movement speed, and the speed of individual technical actions.

Reaction speed refers to the time required to respond to a stimulus. In fencing, this may involve reacting to an opponent's attack, a change in distance, or an unexpected movement.

Movement speed is associated with the rapid execution of footwork, including forward and backward movements. It allows athletes to control distance and change positions effectively.

Technical speed refers to the ability to perform specific fencing actions quickly and accurately. Examples include lunges, attacks, defensive movements, and counterattacks.

These forms of speed are interconnected. Effective training should therefore develop them together rather than treating them as completely separate qualities.

DEVELOPMENT OF REACTION TIME

Reaction time is an important factor in competitive fencing. Athletes must respond to visual and movement-related information while maintaining control of their own actions.

One effective method of developing reaction ability is the use of visual signals. During training, the coach gives a signal through a hand movement, coloured object, or other visual indicator. The athlete must respond with a predetermined movement.

Another method involves paired exercises. One athlete performs an attacking or defensive movement, while the partner responds according to the situation. This exercise helps develop attention, anticipation, and the ability to react to changing movements.

Training with different starting positions can also improve reaction ability. Athletes may begin in a fencing stance or another prepared position and respond to an unexpected signal.

The exercises should gradually become more complex. Initially, athletes should respond to simple and predictable signals. Later, the coach can introduce different signals and situations that require independent decisions.

MODERN METHODS FOR DEVELOPING SPEED

The development of speed requires systematic training and appropriate exercise selection.

The following methods can be used in fencing preparation.

Repeated exercise method. Athletes perform short-duration movements several times with sufficient recovery between repetitions. This method helps improve movement speed and technical accuracy.

Interval training method. Short periods of intensive activity are combined with planned rest intervals. This approach can be used to improve special speed endurance.

Competitive method. Athletes perform exercises in the form of small competitions. This increases motivation and encourages the application of speed abilities under pressure.

Game method. Different movement-based games and reaction tasks help develop attention, coordination, and rapid decision-making.

Paired training method. Athletes perform exercises with partners, responding to different offensive and defensive actions. This method is especially useful for developing fencing-specific reaction abilities.

The selection of a method should depend on the age, physical development, and technical preparation of the athlete.

THE ROLE OF COORDINATION IN SPEED DEVELOPMENT

Speed in fencing cannot be considered independently of coordination. Athletes must coordinate their arms, legs, and body movements while observing the opponent.

Poor coordination can reduce the accuracy of technical actions, even when an athlete possesses sufficient physical speed.

Coordination exercises should therefore be included in regular training sessions. These may involve changes of direction, movement combinations, balance tasks, and exercises performed in response to visual signals.

Footwork exercises are particularly important. They help athletes improve movement control, maintain balance, and change distance efficiently.

The combination of speed and coordination training allows young fencers to perform technical movements more accurately and consistently.

INDIVIDUAL APPROACH TO TRAINING YOUNG FENCERS

Young athletes differ in their physical development, reaction abilities, coordination, and previous sporting experience. For this reason, a single training programme may not be equally effective for every participant.

An individual approach makes it possible to select exercises according to the athlete's current level of preparation.

At the initial stage, training should focus on basic movements, simple reaction exercises, and the correct execution of technical actions.

As the athlete develops, more complex tasks can be introduced. These may include responding to different signals, performing movements under changing conditions, and participating in controlled practice bouts.

Training loads should be increased gradually. Excessive intensity and insufficient recovery may lead to fatigue and reduce the quality of technical performance.

THE USE OF MODERN TECHNOLOGIES IN FENCING TRAINING

Modern technologies provide additional opportunities for improving the quality of sports training.

Video recording allows coaches to analyze the speed and accuracy of athletes' movements. By reviewing recordings, athletes can identify technical mistakes and understand how their movements can be improved.

Electronic reaction-testing equipment can be used to evaluate responses to visual signals. Such tests may help coaches monitor changes in reaction performance over time.

Digital tools can also support the organization of individual training programmes and the recording of training results.

However, technology should be used as a supporting instrument. It cannot replace qualified coaching, systematic physical preparation, or direct practical training.

THE RELATIONSHIP BETWEEN SPEED AND TACTICAL PREPARATION

Speed and reaction ability are closely related to tactical preparation. A fast response is useful only when the athlete selects an appropriate action.

For example, responding immediately to an opponent's movement without evaluating the situation may result in an ineffective attack or an unsuccessful defensive action.

Therefore, training should combine reaction exercises with tactical decision-making tasks.

Practice bouts provide favourable conditions for this purpose. During these activities, athletes learn to recognize different situations, select appropriate movements, and adapt their actions to the opponent's behaviour.

The development of tactical awareness makes speed more effective in real competitive conditions.

RECOMMENDATIONS FOR ORGANIZING TRAINING SESSIONS

An effective training session should include exercises aimed at developing general physical fitness, special speed, reaction ability, and technical skills.

The preparatory part should include running, joint mobility exercises, dynamic movements, and basic fencing footwork.

The main part should focus on short speed exercises, visual reaction tasks, paired activities, and technical movements performed at different speeds.

The final part should include low-intensity movements, breathing exercises, and stretching.

Coaches should ensure that athletes perform speed exercises while maintaining correct technique. When fatigue becomes excessive, movement accuracy and reaction quality may decrease.

Regular monitoring of athletes' physical condition is also necessary to adjust training loads and ensure adequate recovery.

DISCUSSION

The theoretical analysis indicates that the development of speed and reaction ability in fencing requires an integrated approach. Physical exercises alone are not sufficient to develop the complex responses needed during competitions.

Training should combine reaction exercises, technical movements, coordination tasks, and tactical situations. This allows athletes to improve not only the speed of their movements but also the quality of their decisions.

The use of paired exercises and practice bouts is particularly important because these activities reproduce some of the changing conditions of competitive fencing.

Individualization is another essential factor. Coaches should select training methods according to the athlete's preparation level and gradually increase the difficulty of exercises.

Thus, an integrated and systematic training process creates favourable conditions for improving the speed and reaction abilities of young fencers.

CONCLUSION

Speed and reaction ability are among the fundamental physical qualities required for successful fencing performance. They influence the athlete's ability to respond to an opponent, perform technical actions, control distance, and make decisions during competitions.

The development of these qualities should be based on systematic physical exercises, paired training, reaction tasks, and competitive activities.

Special attention should be paid to coordination, technical accuracy, tactical thinking, and individual characteristics of young athletes.

Modern technologies, including video analysis and electronic reaction testing, can support the evaluation and improvement of training performance.

In conclusion, the effective development of speed and reaction abilities requires a scientifically based approach, qualified coaching, gradual increases in training loads, and the integration of physical, technical, and tactical preparation.

PRACTICAL RECOMMENDATIONS

1. Include visual reaction exercises in regular fencing training sessions.
2. Use short-distance acceleration and footwork exercises to improve movement speed.
3. Organize paired exercises to develop responses to opponents' actions.
4. Combine speed exercises with technical and tactical tasks.
5. Use video analysis to evaluate movement accuracy.
6. Adapt training intensity to the age and physical condition of athletes.
7. Provide sufficient recovery between intensive exercises.
